Assignment Weight: 1.0

1. Complete the function body.

```
def greatest_difference(nums1, nums2):
    """ (list of number, list of number) -> number

Precondition: len(nums1) == len(nums2) and nums1 != []

Return the greatest absolute difference between numbers at corresponding positions in nums1 and nums2.

>>> greatest_difference([1, 2, 3], [6, 8, 10])
    7

>>> greatest_difference([1, -2, 3], [-6, 8, 10])
    10

"""
```

2. Complete the function body.

11 11 11

```
def can_pay_with_two_coins(denoms, amount):
    """ (list of int, int) -> bool
```

Return True if and only if it is possible to form amount, which is a number of cents, using exactly two coins, which can be of any of the denominations in denoms.

```
>>> can_pay_with_two_coins([1, 5, 10, 25], 35)
True
>>> can_pay_with_two_coins([1, 5, 10, 25], 20)
True
>>> can_pay_with_two_coins([1, 5, 10, 25], 12)
False
```

3. Complete the function body.

```
def all_fluffy(s):
    """ (str) -> bool

    Return True iff every character in s is fluffy. Fluffy characters are
    those that appear in the word 'fluffy'.
    >>> all_fluffy('fullfly')
    True
    >>> all_fluffy('firefly')
    False

    """
```

4. Complete the function body.

```
def digital_sum(nums_list):
    """ (list of str) -> int

    Precondition: s.isdigit() holds for each string s in nums_list.

Return the sum of all the digits in all strings in nums_list.

>>> digital_sum(['64', '128', '256'])
34
>>> digital_sum(['12', '3'])
6
```

- 5. In math, the Collatz conjecture states that starting from any positive integer, you will eventually reach the number 1 by repeatedly applying the following two rules:
 - if the number is even, divide it by 2 to get the next number in the sequence
 - if the number is odd, multiply by 3 and add 1 to get the next number in the sequence

Repeatedly applying the rules generates a sequence of numbers. The Collatz step count is the number of applications of the rules required before the sequence reaches 1. For example, there are 8 Collatz steps in the Collatz sequence:

```
n=6 \rightarrow n=3 \rightarrow n=10 \rightarrow n=5 \rightarrow n=16 \rightarrow n=8 \rightarrow n=4 \rightarrow n=2 \rightarrow n=1 Complete this function to count the Collatz steps for a particular number n.
```

```
def count_collatz_steps(n):
    """ (int) -> int

Precondition: n >= 1

Return the number of steps it takes to reach 1 by applying the two rules of the Collatz conjecture beginning from the positive integer n.

>>> count_collatz_steps(6)
8
"""
```

Before 11:59:59 p.m., Friday, 16 April 2021 (2nd Friday), you must upload a hw1.py file with all your solutions of the above questions to the course Blackboard assignment for Homework 1.
